Cultural
contexts

Creating and conducting collaborative interdisciplinary research is a critical and necessary skill in the context of 21st century global change. This course is designed to assist graduate students in navigating their way successfully through the interdisciplinary process, in the context of their research focus as it is at present. There are many ways to approach interdisciplinarity, from initial project development through to the production of research outputs. As Marzano, Carss and Bell observe: 'interdisciplinarity is dynamic, being the integration of 'ways of thinking' as part of the development of a 'way of working' (2006: 194). This course will only 'scratch the surface' of this dynamic and evolving practice but nonetheless, will provide important insights and paradigms for interdisciplinary research.
