

**PHYS 251: Introduction to Computer Techniques in Physics
Spring 2023**

Lecture: Monday and Wednesday 10:30 – 11:45 am

Classroom: Exploratory Hall, Room 1004

Instructor:

- Dr. Fernando E. Camelli
- E-mail: fcamelli@gmu.edu
- Office: Planetary Hall, Suite 103, #101C
- Office Hours:
 - In person: Mondays and Wednesdays after class.
 - virtual or in person by appointment.
- Course Modality: face-to-face.

Course Description:

Introduction to using computers in physics based on examples from mechanics and astronomy. Fulfills Mason Core requirement in information technology (all except ethics).

Prerequisite(s): C or higher in PHYS 160. Prerequisite enforced by registration system.

About this Class:

Each class meeting (75 minutes each) will be split into two parts. In the first part, new information will be presented. In the second part, students will work on problems.

The material you need for this class is on Blackboard. You are expected to review the material before each class. All the topics and problems for this class are covered in the lectures available on Blackboard. The lecture notes contain example problems and activities.

You will need to have access to a computer for this class. Any kind of computer will be fine. It does not need to be new or last generation. Your computer can be Windows type, Linux type, or Mac.

The only require software for this class is Python and it is free. We will cover the steps to install it on your computer in the first week of class.

This is an activity-driven class; I will not be giving extensive lectures on each topic. Instead, I will give a brief overview of the topic and then provide activities that you will work on in class. The homework assignments are typically based in part on the activities that you worked on in class.

Attendance to this class is mandatory. If you miss a class, you will find the homework assignments to be difficult.

Objectives:

- To develop proficiency with basic programming syntax in a high-level procedural programming language Python.
- To use a programming language to numerically solve basic physics and engineering problems encountered in first-year coursework.

- To be proficient in developing ideas for ways to predict expected features of a solution to a problem that can be only solved numerically.
- To be proficient in developing ideas for ways to determine if a numerical solution is physically reasonable or correct.
- To use a programming language to analyze and visualize data.
- To have experience using packages for one or more programming languages to solve advanced programming and data analysis problems that will be encountered in the physics and engineering curriculum.
- To develop proficiency in troubleshooting, debugging, validation, and verification of computer programs.

Topics and Draft Outline:

The first four weeks of this course involve learning the programming features that are needed to solve physical problems. The remainder of the class involves writing programs to solve problems encountered in a first-year undergraduate physics course, i.e., classical mechanics. Some problems have analytic solutions while others do not, and a numerical method is needed to solve them. Only two numerical techniques are covered: numerical integration and numerical solutions to differential equations. The number of methods and the number of topics covered in this course is intentionally not large; an emphasis is placed on proficiency and a deep understanding of fundamentals. A significant emphasis is placed on developing an intuition for how to develop a program for different problems, how to determine if the numerical solution is logical, and how to predict features of the expected solution to problems based on physical reasoning and theory.

- Week 1: Information technology. Introduction to Python. How to write a simple Python script.
- Week 2: Control statements and 1-D iteration.
- Week 3: Linear algebra.
- Week 4: Matrices and iteration in 2-D.
- Week 5: Data analysis. Plots.
- Week 6: Linear and nonlinear regression.
- Week 7: Numerical integration.
- **Week 8: Spring recess: no classes from Monday March 13 to Sunday March 19.**
- Week 9: Newton's Laws and equation of motion.
- Week 10: Introduction to numerical solutions of Ordinary Differential Equations (ODE).
- Week 11: ODE's: Euler-Cromer. Coupled ODE's.
- Week 12: Solving 1-D harmonic oscillator problems.
- Week 13: Solar system, solving the 2-body problem.
- Week 14: Using Python modules to solve ODE's.
- Week 15: Review.

Textbook:

The textbook used in this class is available online in the University Library: ["Learning Scientific Programming with Python"](#), Christian Hill, Cambridge University Press, 2020.

The following list is a sample of books available in the University Library. Some of these books are available online:

- "Computational Physics," Mark Newman, 1st Edition revised and expanded, 2013.
- ["Computational Physics: Problem Solving with Python"](#), Rubin H. Landau, Manuel J. Paez and Cristian C. Bordeianu, 3rd Edition, 2015.
- ["Elementary Mechanics Using Python"](#), Anders Malthe-Sørenssen, 2015.

- [“A Primer on Scientific Programming with Python”](#), Hans Petter Langtangen, 4th Edition, 2014.
- “Numerical Analysis,” Tim Sauer, 2nd Edition, 2014.
- “Numerical Analysis,” Richard L. Burden and J. Douglas Faires, 1993.
- [“Python and Matplotlib Essentials for Scientists and Engineers”](#), Matt A. Wood, 2015.
- [“Mastering Matplotlib”](#), Duncan M. McGregor, 2015.
- [“Numerical Python: A Practical Techniques Approach for Industry”](#), Robert Johansson, 2015.
- [“NumPy: Beginner's Guide”](#), Ivan Idris, 3rd Edition, 2015.
- [“NumPy Essentials”](#), Leo Chin and Tanmay Dutta, 2016.
- [“SciPy and NumPy”](#), Eli Bressert, 2012.
- [“Python Data Analytics: Data Analysis and Science Using Pandas, matplotlib, and the Python Programming Language”](#), Fabio Nelli, 2015,

References:

The following books are additional references covering Computational Physics at the Junior/Senior undergraduate level.

- “Computational Physics,” Nicholas Giordano and Hisao Nakanishi, 2nd Edition, 2006.
- [“Basic Concepts in Computational Physics”](#), Benjamin A. Stickler and Ewald Schachinger, 2014.

Grading:

- Projects: 50% - One midterm project and one final project, equally weighted.
- Homework: 45% - The lowest homework grade is dropped. A deduction of 10% of the grade will be applied to late homework. I will not accept homework assignments after one week of the deadline.
- Attendance: 5%

Letter Grades:

- > 97: A+
- 93 to 96.9: A
- 90 to 92.9: A-
- 87 to 89.9: B+
- 83 to 86.9: B
- 80 to 82.9: B-
- 77 to 79.9: C+
- 73 to 76.9: C
- 70 to 72.9: C-
- 60 to 69.9: D
- < 60: F

Homework:

You will have to complete a series of assignments during the semester. In these assignments, you must write Python scripts. In addition, you must write a single report for the results of the assignment and add a paragraph explaining each script. The report must be typed and must be submitted in pdf format[†].

Each assignment may require writing several Python scripts. You must include your full name and problem number at the top of each script. Your scripts must be commented on. Your comments must explain what you are doing in that section of the script.

[†][How to save a file in pdf format.](#)

Projects:

You will work on the midterm and final projects individually. You can ask me questions about the projects during office hours. You must not use someone else's computer code in any of the projects, except code that is provided during class. You must write an original computer code for the projects. You will explore a scientific question that may not be easily answered without the help of a computer.

The midterm project will require you to write a computer code to answer a scientific question and present your results in a written paper. The written paper only requires presenting and explaining your results with tables or plots and a conclusion section. You should expect that the midterm project will be slightly more difficult than the homework.

The final project encompasses the analysis and interpretation of the data produced by your computer code. The deliverable of the final project is the computer code, and a full paper describing the project, the numerical methods used in your code and the analysis of the data produced by your code. The paper final project paper will be organized with the following sections: (a) introduction, (b) description of the problem, (c) results, and (d) conclusions. Examples of scientific papers will be introduced in the class to help you to draft your final paper.

Homework and Projects: Writing Code and Collaboration

Collaboration between students is encouraged. However, there are rules that apply to collaboration when you are working with others.

The following rules are from the honor code of the Computer Science Department at Stanford University (<https://cs.stanford.edu/degrees/ug/HonorCode.shtml>):

- You must not look at solutions or program code that are not your own.
- You must not share your solution code with other students.
- You must indicate in your submission any assistance you received.

You can work together with your laptops closed and on a whiteboard. However, the moment laptops are opened, the collaboration should stop.

If collaboration did not help you to understand how to solve a problem, office hours are your best resource to succeed.

Please follow these simple rules.

Email Communication:

Please send all your questions to me via email. Here are a few things to remember to make email communication better.

- Please use your name in the salutation so that I do not have to look up your name given only your Mason email address. There is a way of setting up your email, consequently your full name appears in the header - see below.
- If you have a question about a program, copy it inline in the email body, or attach it.
- Always tell me what you tried and read and be specific about your point of confusion. Otherwise, I may guess incorrectly why you are confused. You will oftentimes find that if you write out a question, in the process of trying to make yourself clear about your point of confusion, you will realize the answer to your question.

How to show your full name in MasonLive emails:

1. Log in to your MasonLive account.
2. Click on the 'Settings Gear' at the top right of your window, then select 'Options' from the drop-down list.
3. On the left-hand menu click 'General', then click on 'My Account'.
4. On the 'My Account' screen, type in your full name in the 'Display Name' area, then click 'Save'.

Student and Faculty Names and Pronouns:

Gender identity and pronoun use: If you wish, please share your name and gender pronouns with me and how best to address you in class and via email. I use he/him/his for myself and you may address me as Fernando, or Prof. Camelli in email and verbally.

Academic Integrity:

The integrity of the University community is affected by the individual choices made by each of us. Mason has an Honor Code with clear guidelines regarding academic integrity. Three fundamental and rather simple principles to follow at all times are that: (1) all work submitted be your own; (2) when using the work or ideas of others, including fellow students, give full credit through accurate citations; and (3) if you are uncertain about the ground rules on a particular assignment, ask for clarification. No grade is important enough to justify academic misconduct. Plagiarism means using the exact words, opinions, or factual information from another person without giving the person credit. Writers give credit through accepted documentation styles, such as parenthetical citation, footnotes, or endnotes. Paraphrased material must also be cited, using the appropriate format for this class. A simple listing of books or articles is not sufficient. Plagiarism is the equivalent of intellectual robbery and cannot be tolerated in the academic setting. If you have any doubts about what constitutes plagiarism, please see me.

Referencing Policy:

It is quite unlikely that any homework problem will have a solution available on an external website, and you are encouraged to use other resources to help you with parts of a problem. If you used a website or a book while doing your homework, please reference it. This is a good habit to have when you do any programming or writing.

Software:

All software needed for this course is available to GMU students free of charge. Students will build on example code in Python; no prior experience with other languages is expected. We will also experiment with Python during the class.

Academic Calendar: [GMU Academic Calendar](#)

Policies in Continuing Pandemic:

All students taking courses with a face-to-face component are required to follow the university's public health and safety precautions and procedures outlined on the university Safe Return to Campus webpage (<https://www2.gmu.edu/safe-return-campus>).

University Policy:

The University Catalog, <http://catalog.gmu.edu>, is the central resource for university policies affecting student, faculty, and staff conduct in university academic affairs. Other policies are available at <http://universitypolicy.gmu.edu/>. All members of the university community are responsible for knowing and following established policies.

Disability Accommodations:

If you have a learning disability or other condition that may affect academic performance, please: a) make sure documentation is on file with Office of Disability Services (SUB I, Rm. 4205; 993-2474; <http://ods.gmu.edu>) to determine the accommodations you need; and b) talk with me to discuss your accommodation needs.

Counseling and Student Support:

- Counseling and Psychological Services provides confidential psychological services, including 24/7 crisis intervention and consultation to faculty and staff: <http://caps.gmu.edu/>
- Student Support helps students negotiate life situations by connecting them with appropriate on- and off-campus resources <https://ssac.gmu.edu/>

Celebrating our Diversity:

The College of Science, an intentionally inclusive community, promotes and maintains an equitable and just work and learning environment. We welcome and value individuals and their differences including race, economic status, gender expression and identity, sex, sexual orientation, ethnicity, national origin, first language, religion, age, and disability.

- We value our diverse student body and desire to increase the diversity of our faculty and staff.
- We commit to supporting students, faculty and staff who have been the victims of bias and discrimination.

- We promote continuous learning and improvement to create an environment that values diverse points of view and life experiences.
- We believe that faculty, staff, and students play a role in creating an environment that engages diverse points of view.
- We believe that by fostering their willingness to hear and learn from a variety of sources and viewpoints, our students will gain competence in communication, critical thinking, and global understanding, aware of their biases and how they affect their interactions with others and the world.

Mason University Life religious holiday calendar:

<https://ulife.gmu.edu/religious-holiday-calendar/>

It is your responsibility, within the first two weeks of the semester, to let me know the dates of major religious holidays on which you will be absent or unavailable due to religious observances.

Student Privacy: <https://registrar.gmu.edu/ferpa/>

Student services:

- Keep Learning, Learning Services (learningservices.gmu.edu/keeplearning/)
- University Libraries (library.gmu.edu)
- Writing Center (writingcenter.gmu.edu)
- Counseling and Psychological Services (caps.gmu.edu)
